

Project Title:

Exploratory Testing of Google Gemini AI Chatbot

Prepared by:

Jainamkumar Mukeshbhai Mochi

Date:

12'th July 2026

1. Introduction

Objective:

To evaluate the behavior, strengths, limitations, and reliability of Google Gemini AI through exploratory testing.

Url:

gemini.google.com

Tools Used

Google Gemini

2. Test Cases

Test Scenario	Steps Performed	Observation / Finding	Status
Factual Accuracy	Asked questions on history, science, and current affairs	Mostly accurate, but sometimes provided outdated information	Pass
Response Consistency	Asked the same question multiple times with slight variations	Slight repetition and wording changes observed	Pass
Creativity & Code Generation	Requested short stories and simple Python code	Good creativity, but generated code had minor errors	Pass
Safety & Bias Handling	Asked sensitive or controversial topics	Handled responsibly with proper safeguards	Pass
Response Quality & Speed	Tested response time and formatting	Fast responses (under 3 seconds) with good structure	Pass

3.Key Learnings

- AI tools can show slight repetition and variations even when performing the same operation multiple times.
- Important of testing for consistency, hallucination, and edge cases in AI systems.
- Prompt engineering plays a key role in getting better results from AI.

4.Conclusion

This project gave me practical exposure to testing AI-powered tools. I am particularly interested in AI/ML testing and eager to contribute as a QA Intern in this domain.
